

Codex Desktop Operator Mode

Fresh machine
agent-chat flow

Start with the GitHub source on a fresh machine. Existing machines should detect first, then update. The Codex plugin gives global skills and routing; each project still owns its lanes, roadmap, memory, tasks, handoffs, and system map.

- Fresh**
Use repo URL and branch.
- Existing**
Detect plugin and project.
- Local test**
Pin the V3 branch source.

1 Install Global Plugin
Use the official marketplace when available. Otherwise give Codex the source repo and branch.

Fresh machine: install the Operator Kit Codex plugin from <https://github.com/Agent-Operator-Kit/operator-kit.git>. Use main for stable, or codex/v3-integration for V3 testing. Run the plugin dry-run first, show the changes, then install only if correct.

2 Create Project Foundation
Do this inside the target repo or scoped project root before any agent dispatch.

operator install
Set up Operator for this project. If this is a new scoped workspace, propose code/app plus operator. Inspect first, report the plan, and stop before dispatch.

3 Project Foundation Must Report

Scoped layout
code/app plus operator, or detected repo root.

Lanes
Owner lanes, worktrees, branches, and file boundaries.

Architecture
Repos, modules, contracts, risks, and dependency edges.

System map
Generated or refreshed map before planning.

Role catalog
Roles, approved patterns, validation recipes, gates.

Validation
Build, test, lint, smoke, and review commands.

Memory
Project facts, task facts, and retrieval readiness.

Roadmap
Inbox, RM-* status, blockers, and setup gaps.

4 Recommended Agent Order

Agent	Use when	Ask for
Incubate	Idea is rough, risky, or not yet a project.	Frame thesis, customer, wedge, risks, next experiment, promotion brief.
Design agent	Product shape, UX, UI system, or visual task quality matters.	Design-system assumptions, UX review, UI task packet, design lane guidance.
Feedback	You are testing screens, mobile builds, annotations, or raw observations.	Evidence capture and classified FB-* intake, not implementation.
Planner	Feedback needs priority, grouping, roadmap, or lane-ready decisions.	RM-* roadmap items, now/next/later, owner lane, acceptance criteria.
Operator	Work is ready for setup, lane orchestration, execution, or integration loop.	Status, dispatch preflight, task packets, collect, review, memory updates.

5 Observe And Execute Loop
Observe first. Active mode can shape work. Dispatch still needs a clear task and lane.

operator observe
status
what is blocked?
summarize roadmap

operator active
create the confirmed task packet.

operator dispatch
dispatch the approved lane task.
collect the lane handoff and review it.

6 Check, Update, Disable
Use this after install, after branch changes, or when a project feels out of sync.

Check whether Operator is installed and current. Report plugin availability, project config, lane health, system map, memory, roadmap, and update path. Preview updates first and preserve project-local state.

operator off
